### EXAMINER'S AMENDMENT

1. A response was received on 15 September 2009. By this response, Claim 1 has been amended. No claims have been added or canceled. Claims 1, 2, 4, 5, and 7-10 are currently pending in the present application.

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

3. The application has been amended as follows:

#### IN THE CLAIMS:

Please **REPLACE Claim 7** with the following amended claim:

7. The protocol according to claim [[6]] 1, where the time taken to return an indication the second chip is invalid is the same for all bad inputs, and the time taken to return the secret random number encrypted with the second key is the same for all good inputs.

***Allowable Subject Matter***

4. Claims 1, 2, 4, 5, and 7-10 are allowed.

5. The following is an examiner's statement of reasons for allowance:

Independent Claim 1 is directed to a validation protocol for determining authenticity of a printer consumable (e.g. ink or toner cartridge), where the protocol includes generating a random number and calculating a signature for the random number in a first authentication chip in a printer, encrypting the random number and signature using a first symmetric key and sending the encrypted number and signature to a second authentication chip in the printer consumable, decrypting the encrypted number and signature and validating the signature in the second chip, encrypting the random number and a memory vector using a second symmetric key in the second chip and returning the encrypted number and memory vector to the first chip, and calling a test function in the first chip that compares the received random number with the originally generated random number and validates the chip and authorizes use of the consumable if the numbers match and denies use of the consumable if the numbers do not match. Claim 1 further requires that the memory vector include variables holding updatable state data of the consumable and that updating the updatable state data requires clearing of the memory vector when access is attempted in order to change the manner of updating. The closest prior art, Carmon, Sony (Kusakabe), Spies, Merritt, Gilliland, and Schneier, in combination discloses a validation protocol for determining authenticity of a printer consumable that includes, *inter alia*, similar steps of encrypting

Art Unit: 2437

using a first key, sending, decrypting, re-encrypting using a second key, returning, and comparing a random number, the use of the digital signature, and the inclusion of a memory vector including updatable consumable state data. However, none of the cited prior art teaches or suggests, alone or in combination, the limitation that updating the state data requires clearing the memory vector if access is attempted to change the manner of updating in combination with the other steps as claimed. Therefore, the claims are allowable over the cited prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
